Standard LED Lights Brighten the Benefits of Serco Restraints & Communication Systems

LED interior and exterior communication lights are now standard on Serco Vehicle Restraints.

LED lights provide distinctly superior visual communication between the dock worker and truck driver than traditional incandescent lights, even in direct sunlight.

LED lights are now standard on many Serco dock products including the PitBull® Safety-Loc® and Safety-Loc® SLP vehicle restraints, SAFETY-CHOCK™ and UTC wheel restraints, as well as the MLS & ALS Light Communication Systems. Currently, competitive dock equipment brands offer LED's as an option.

Thanks to a significantly longer life than regular incandescent bulbs, LED lights drastically reduce potential risk of costly accidents resulting from miscommunication when lights are burned out. In addition, LED's are highly visible in the rain and fog.

LED lights also eliminate costly "light mimic" upgrades to alert dock workers to burned out bulbs. Made to glow hundreds of thousands of hours, LED lights eliminate unproductive bulb replacement downtime and substantially reduce maintenance costs.

Serco is a leading manufacturer of innovative and high quality for making logistics operations more efficient.
